SUMMARY

Full stack engineer with 4+ years in production. Currently builds healthcare billing CRMs on Next.js 16, React 19, NestJS and Prisma: patients, appointments, insurance claims, billing ledgers and payments. Authorization enforced on the server on every route, audit trails over patient data, and end-to-end tests that fail when the code breaks. Reviews other people's branches before they merge, and reads an execution plan before changing a query.

TECHNICAL SKILLS

- **Frontend:** Next.js 16 (App Router), React 19, TypeScript, Redux Toolkit, RTK Query, React Query, Tailwind CSS, Shadcn UI
- **Backend:** NestJS, Node.js, Express.js, Prisma, REST APIs, Stripe webhooks, cron jobs, session auth, role-based permissions, OTP email auth
- **AI / LLM:** Claude API, OpenAI and OpenRouter APIs, LangGraph, RAG, prompt engineering
- **Database:** PostgreSQL, Prisma, MongoDB (indexing, execution plans, aggregation pipelines), Supabase, Redis
- **DevOps:** AWS EC2, S3, Vercel, DigitalOcean, PM2, Nginx, GitHub Actions, Playwright, Jest, Cypress

PROFESSIONAL EXPERIENCE

Decrypted Labs | Full Stack Engineer

Jun 2024 - Present

- Building **Chiro360**, a chiropractic auto-accident billing CRM on **Next.js 16, React 19, NestJS and Prisma**: patients, appointments, visits, CPT/ICD coding, insurance claims, attorney letters of protection, and a visit-based billing ledger across roughly 31 screens.
- Designed the **CPT and visit-based billing model** the rest of that system depends on, covering visits, batch billing, HCFA-1500 claim generation, payments and reporting.
- **Authorization is enforced server-side on every route**, not hidden in the UI: permission guards on each controller, a server-only session layer, and an audit trail over patient records. Backed by **76 Playwright end-to-end tests**, passing.
- Built and run a second healthcare billing CRM for **durable medical equipment**: insurance, orders and rentals, CMS-1500 generation, AWS Textract OCR for script inquiries, S3 document storage and OTP email auth. **One codebase deployed as two white-label instances** for separate clients on isolated databases.
- Responsible for both deployments: EC2 with pm2, GitHub Actions CI, Prisma migrations against production, and secret handling across instances.
- **Review teammates' branches before merge**. Have stopped work from shipping over authorization gaps and queries written in a form that could not use an index.
- Took over a **half-finished cruise booking platform** (React, Node.js, MongoDB) after the original developer left. One handover session, then read the codebase and shipped it: referral and promo code engine, scheduled payouts, and Stripe payment paths where a retried webhook must not pay twice.
- Tuned **IAMDIVINITY**, a data-heavy dashboard serving **3,000+ users**, by moving slow pages to SSR and rewriting the MongoDB queries behind the load times after reading their execution plans.

Ecommerce Inside | MERN Stack Engineer

Jul 2022 - Jun 2024

- Built **Express.js REST APIs** on an MVC structure with MongoDB to back the product's frontend features.
- Built responsive React storefronts and traced rendering and data bugs to root cause, writing up the fixes so the same issues did not come back.

KEY PROJECTS

LightNX Defence Platform | *Next.js, NestJS, PostgreSQL, WebSockets, Mapbox*

- Real-time situational awareness dashboard for a defence client: live asset tracking, alert management, and **role-based access control** over sensitive operational data. Every data path enforced role checks on the server.

AI SDR Agent | *LangGraph, Claude API, Next.js, PostgreSQL*

- Outbound sales agent built as a **LangGraph state machine**: prospect research, message drafting and follow-up sequencing, with human checkpoints between steps. Live at app.umairamir.com.
- Retrieval over a vector store keeps replies grounded in real account data instead of invented detail.

Rock Paper Scissors (on-chain multiplayer) | *Solidity, Next.js, WebSockets*

- Real-time multiplayer game on a **commit-reveal protocol**. Most of the work was in the **race conditions**: reconnection, a player who never reveals, and keeping state consistent across clients when messages arrive out of order. officialrps.com

EDUCATION

BS Computer Science | Virtual University of Pakistan
